CONTENTS

PREFACE

This is the first edition of the Australian Standard Classification of Countries for Social Statistics (ASCCSS).

The Australian Bureau of Statistics (ABS) has produced this classification in line with its commitment to develop, maintain, implement and promote the use of standard classifications, frameworks and definitions to help ensure the compatibility and comparability of data derived from different statistical systems.

The ASCCSS is intended for use whenever demographic, labour and social statistics are classified by country. The ABS will progressively implement the classification in its own statistical work and urges its use by other government agencies and private organisations classifying demographic, labour and social statistics by country.

The ASCCSS will be maintained by the ABS and updated as necessary.

The assistance of organisations and individuals in providing information and advice during the development of the classification is gratefully acknowledged.

ASCCSS

PART 1

EXPLANATORY NOTES

EXPLANATORY NOTES

INTRODUCTION

The Australian Standard Classification of Countries for Social Statistics (ASCCSS) is a classification of countries based on the concept of geographic proximity. It groups neighbouring countries into progressively broader geographic areas on the basis of their similarity in terms of social, cultural, economic and political characteristics.

The classification is intended for use whenever demographic, labour and social statistics are classified by country. For example, the classification should be used when collecting, aggregating and disseminating data relating to personal characteristics such as country of birth, country of residence, country of origin, etc. It is not intended for classifying correlated variables such as the ethnicity of individuals or the language spoken by individuals.

Because of widely varying user requirements, it was judged not possible to develop a single classification of countries that would be suitable for use in all Australian Bureau of Statistics (ABS) collections. For example, many applications in economic statistics require groupings such as EEC, OECD, EFTA, etc., which are of little interest to users of social statistics. The criteria for grouping countries for economic statistics is different from that required by users of demographic, labour and social statistics.

Classifications previously used in the ABS for social, demographic and labour statistics were adaptations of the United Nations (UN) country classification: United Nations Standard Country or Area Codes for Statistical Use, UN Statistical Paper, Series M No 49, Rev. 2, 1982. Major Australian users of social and labour statistics have indicated that the UN classification does not meet their requirements for analytical purposes. The base units of the UN classification are not suitable in all instances because they are either out of date, as the classification has not been updated for some time, or because they do not provide the detail required by Australian users. The aggregations of units in the UN classification are done on a strictly continental basis which results in groups that do not always meet the requirements of Australian users.

Hence, the ASCCSS has been developed giving more emphasis to social, cultural, economic and political criteria and to aggregations of interest to Australian users. However, the base units of ASCCSS are broadly compatible with those of the UN classification and it is possible to aggregate statistics based on these units to the UN classification for the purposes of international comparison.

The identification of country units in the classification, and the way in which they are grouped, does not imply the expression of any opinion on the part of the ABS concerning the legal status of any country, territory, or area, or concerning the delimitation of its frontiers or boundaries.

The ABS intends to use ASCCSS in its own statistical work and urges its use by other government agencies and private organisations classifying demographic, labour and social statistics by country.

CLASSIFICATION UNITS

Although the term *countries* appears in the classification title and is used throughout this document to describe the base level units, not all of the units classified are independent

countries. The exceptions, which have been made to meet the needs of users of the classification, are:

i   Administrative subdivisions of Australia (States and Territories), the United Kingdom (England, Scotland, Wales and Northern Ireland) and the USSR (constituent Republics including the Baltic States);

ii   Overseas dependencies, external territories, bailiwicks, etc., of independent countries. These units are discrete geographic areas with varying degrees of political and economic autonomy. In general, they are physically isolated from the country to which they are dependent eg Falkland Islands, Martinique;

iii   Units which are recognised geographic areas, the ownership or control of which is in dispute eg Gaza Strip, West Bank.

Where administrative subdivisions have been used as classification units, all such subdivisions are included separately in the base (third) level of the classification structure and the country which they comprise is included in the minor group (second) level. In the case of the United Kingdom, however, its appearance in the second level of the structure is in combination with the Republic of Ireland, from which it is often inseparable in Australian statistical collections.

The Antarctic territories have been included in Major Group 1, 'Oceania and Antarctica', to make the coverage of the classification complete, although they are unlikely to be a major source of interest for social and labour statistics.

There are 244 countries and 3 residual categories identified at the third level of the classification.

CLASSIFICATION CRITERIA

Geographic proximity is the basic criterion used to group countries in this classification.

Neighbouring countries are grouped into progressively broader geographic areas on the basis of their similarity in terms of social, cultural, economic and political characteristics. Similarity in terms of social and cultural characteristics has been operationalised in terms of main religion practised and main language spoken.

Although the countries in a classification category are not necessarily identical in any particular characteristics, the groups formed are relatively homogenous in terms of the set of classification criteria.

APPLICATION OF THE CLASSIFICATION CRITERIA

Although geographic proximity is the principal criterion employed in grouping countries, it is considered in conjunction with the characteristics of each country and its neighbours. For example, on the basis of location, Mexico could be included in either a group of countries comprising Northern America or a group of countries comprising Central America. It is included in Central America because it is more similar in terms of social, cultural, economic and political characteristics to countries such as Honduras and Guatemala than to the United States and Canada.

An exception to the use of geographic proximity as the basic classifying criterion is the treatment of Australia's external territories. Because of user requirements, all external territories, except the Australian Antarctic Territory, have been included in the same minor group, although they are geographically wide-spread. The Australian Antarctic Territory is included in a minor group with the other Antarctic territories. There is no user requirement for it to be otherwise treated, and its grouping with other Antarctic territories recognises that the Antarctic Treaty (1 Dec. 1959) does not support or deny national claims to territorial sovereignty in Antarctica but preserves the *status quo* with regard to territorial sovereignty, rights and claims for the duration of the treaty.

In a few instances it has been necessary to include a country in a group of countries with which it has little in common in terms of the classification criteria. The Falkland Islands, for example, are geographically close to South American countries, but are unlike the other countries in this area. Although unlike other South American countries, the Falkland Islands has been included in a group of countries comprising South America because there are no other proximate countries with which it is similar.

A country, even if it comprises other discrete political entities, such as states, is treated as a single unit for all classification purposes. Parts of a political entity have not been included in different groups. Thus, Hawaii was included in Northern America (as part of the identified country USA) despite being close to and having similar social and cultural characteristics to Polynesian countries.

CLASSIFICATION STRUCTURE

The classification contains 3 levels.

The third and most detailed level of the classification consists of the base units which are discrete countries as described above, see **CLASSIFICATION UNITS**. The classification consists of 247 third level units including 3 'other' categories which are explained below, see **Supplementary Codes**.

The second level of the classification comprises 24 minor groups, which are regional groups of countries similar in terms of social, cultural, economic and political characteristics. Minor groups contain between 1 and 25 countries.

The first and most general level of the classification comprises 9 major groups. These are formed by aggregating proximate minor groups and, therefore, comprise countries which are only broadly similar in terms of social, cultural, economic and political characteristics. Four of the major groups consist of 1 minor group only.

CODING SCHEME

One, two and four digit codes are assigned to the first, second and third level units of the classification respectively. The first digit identifies the major group in which each country or minor group is contained. The first two digits taken together identify the minor group in which each country is contained. The four digit codes represent each of the 247 country level units.

From time to time it may be necessary to add countries to, or delete countries from, the classification.

If a country needs to be added to the classification, it will be allocated the next available four digit code, in the numerical sequence of codes, of the minor group to which it is being added.

If a country ceases to exist as a separate entity, and it is consequently deleted from the classification, its code will not be re-allocated to another country as this will complicate the storage of time series data. If it is necessary to move a country from one minor group to another, it will be allocated the next available code of the minor group to which it is moved. Its previous code will not be re-allocated.

The countries in most minor groups are in alphabetical order. However, the current order of units is more expedient than necessary and it is not considered that the addition of new units, which may disrupt the alphabetical order, will affect the usefulness of the classification.

The ASCCSS coding scheme is devised so that any future changes to the classification structure are easily accommodated. However, in order that the classification remain a standard, users should not make changes to the structure. They should contact the ABS and identify any apparent problems they encounter in the course of implementation or analysis.

A particular problem at the time of publication is the probability of political change in Eastern Europe. The classification structure has been designed, as far as possible, to minimise the effects of such change. If, in the course of time, a need for amendment to the structure is indicated, the ABS will make the required changes and issue revisions of the classification.

Reserved Codes for Residual Categories

In each minor group a four digit code, consisting of the two digits of the minor group followed by the two digits 99, is reserved as a residual or 'other' category. All geographic areas within the region described by a minor group, which are not separately identified in the classification, and not part of one of the identified countries, are included in the residual or 'other' category.

ABS experience indicates that the need for residual categories only arises in three instances:

      1299   Other Australian External Territories,
      1699   Other Polynesia (excluding Hawaii), and
      3299   Other North Africa.

These three categories have, therefore, been separately identified in the classification. Provision exists in the coding structure for the creation of additional residual categories should experience indicate they are necessary.

Supplementary Codes

Supplementary codes are used to process inadequately described responses in statistical collections. The codes are of two types:

- Codes ending with '00' or '000', and
- Codes commencing with '000'.

Codes ending with two or three zeros (described as 'not further defined' codes) are used to code responses which cannot be coded to the detailed (country) level of the classification but which can be coded to a higher level of the classification structure.

For example, responses relating to places, regions, etc., which cannot be identified as lying within the boundaries of a country separately identified in the classification, but which lie wholly within the boundaries of one of the classification's minor groups, are coded to that minor group. Such responses are allocated a 'not further defined' code consisting of the two digit code of the particular minor group followed by '00'.

Similarly, responses relating to places, regions, etc., which cannot be identified as lying within the boundaries of a country separately identified in the classification, or one of the classification's minor groups, but which lie wholly within the boundaries of a major group, are coded to that major group. Such responses are allocated a 'not further defined' code consisting of the one digit code of the particular major group followed by '000'.

Thus, places which are only codable at the major or minor group levels of the classification can be processed within a collection coded at the country level.

Four digit codes commencing with '000' are supplementary codes, included for operational purposes, to facilitate the coding of responses, such as inadequately described countries, at sea, etc., which present particular problems in that they cannot be allocated a country, minor group or major group code.

Coding Index

Responses provided in statistical collections do not always relate directly to classification categories. A coding index is therefore necessary to act as the link between responses and the classification, enabling responses to be coded to the appropriate category in the classification.

The Coding Index has been developed to assist in the implementation and use of the classification and should be used when coding responses to questions relating to country of birth, country of origin, etc. The Coding Index has been devised, in the main, from other coding indexes used in ABS collections, and is thus based on responses actually obtained in ABS censuses and surveys. It contains a comprehensive list of the most probable responses provided in statistical collections and their correct classification codes. See **Part 3** for Coding Indexes in both alphabetical and numerical order.

Coding Rules

In developing the Coding Index a number of rules were followed in assigning index entries the correct classification code. It is recommended these rules be adhered to when coding any response which does not appear in the Coding Index provided. The coding rules are outlined below.

Responses relating directly to a country separately identified in the classification are, of course, coded to that country.

Responses relating to places, towns, regions, states, etc., which lie wholly within the boundaries of a country separately identified in the classification, and which are part of that country, are coded to that country.

Responses relating to places, regions, etc., which cannot be identified as lying wholly within the boundaries of a country separately identified in the classification are assigned a 'not further defined' code, or the code of a residual category, as described above. See **Supplementary Codes** and **Reserved Codes for Residual Categories** above.

Changes in national boundaries create particular difficulties for coding country of birth responses to a classification of countries.

Because many uses of the classification refer to the citizenship or nationality of persons (overseas arrivals and departures for instance) it is preferable that each person's country of birth be coded according to national boundaries existing at the time of the collection, so that the classification can be used in a consistent manner for all applications. However, as it is not feasible to research each response, all responses relating to a country which currently exists, but has changed its boundaries, are coded to the named country. For example, all persons who give their country of birth as 'Poland' are coded to Poland, even though the boundaries of Poland may have changed since they were born and they may have in fact been born in a place that is now in East Germany. Therefore, in a small number of cases the place of birth of individuals will be incorrectly coded.

Responses relating to countries which have changed name, without changing boundaries, are coded to the latest name in the classification. Thus the response 'Upper Volta' is coded to 'Burkina Faso'.

Responses relating to a country which no longer exists are coded to a separately identified country in the classification, if the geographic area the defunct country previously occupied is wholly contained within the boundaries of the contemporary country. For example, the response 'Croatia' is coded to 'Yugoslavia'.

If the area of a country no longer in existence is not wholly contained within the boundaries of one of the separately identified countries of the classification, responses relating to the defunct country are assigned an appropriate 'not further defined' code. For example, a response relating to a country no longer in existence, the previous area of which is not wholly contained within a contemporary country, but is wholly contained within a minor group, is allocated the code of that minor group followed by '00'.

IMPLEMENTATION OF THE CLASSIFICATION

Input Processing

As mentioned in the introduction, it was judged not possible to develop a single classification of countries that would be suitable for use in all ABS collections. However, although country classification structures will vary according to their purpose, they will be based on a standard set of country units. To facilitate input processing of all statistical collections the ABS will use a standard unstructured code list that can be mapped to various classification structures for statistical output.

The 'input' codes assigned are the 3-digit numeric version of the codes for the representation of names of countries published by the International Organization for Standardization (ISO), ISO 3166: 1988 (E/F). These codes were derived initially by allocating a running code with a four digit skip to an alphabetical listing of the country units. Subsequent additions and deletions to the ISO country listing has resulted in some disorder in the running code. The ISO codes do not imply any classification structure.

For demographic, labour and social statistics these country units are mapped to the units of ASCCSS. Some ISO coded units are statistically insignificant for demographic, labour and social statistics and are not separately identified in ASCCSS. These are allocated the codes of the residual or 'other' categories in ASCCSS.

The United Nations standard country classification also assigns ISO codes to its country units. As stated in the Introduction, it is possible to reaggregate the ASCCSS units to the groupings of the UN classification for the purposes of international comparison and this is facilitated by the common use of ISO codes.

A number of supplementary codes are used in ASCCSS to process inadequately described responses. These supplementary categories, which are not included in the ABS standard set of country units, have also been assigned ISO codes from the series of numbers made available for user-assigned codes.

Documents providing links between ASCCSS and ISO codes are provided in **Appendices I and II**. Entries contained in the **Coding Indexes (see Part 3)** are allocated both ISO and ASCCSS codes.

Editing Specifications

As explained in the **CODING SCHEME** above, it is possible for many responses coded to ASCCSS to be assigned codes other than those of the separately identified country units. Such codes include the codes for residual or 'other' categories and supplementary codes for 'not further defined' responses.

It is important, therefore, that in validating input codes at editing stage, manipulating data and deriving output items, the full range of valid codes are included in all specifications.

For example, in the case of the minor group The United Kingdom and Ireland the following codes should be specified for all edits, manipulations and output items.

2100	The United Kingdom and Ireland (not further defined)
2101	England
2102	Scotland
2103	Wales
2104	Northern Ireland
2105	Channel Islands
2106	Isle of Man
2107	Ireland, Republic of

The ASCCSS coding structure makes provision for the creation of additional residual categories (codes ending in '99') if user experience indicates they are necessary. It is essential that all residual categories be included in valid range edits, output specifications, etc. However, residual categories should only be created and used in the circumstances outlined in the **CODING SCHEME** above. They should not be created merely to 'dump' responses containing insufficient information.

Output and Presentation of Data

As stated in the Introduction, this classification is intended for use whenever demographic, labour and social statistics are classified by country.

Wherever possible, data should be captured and stored at the base level of the classification as this will facilitate detailed analysis and the construction of alternative groupings to meet differing user requirements or output conventions. It will also enable the construction of groupings which are comparable with groupings in other collections both past and present.

However, the constraints affecting each collection, such as problems with confidentiality or standard errors, may not permit the output of data at lower levels of the classification. Nevertheless, the use of a standard classification will enhance data comparability, even though it may not always be possible to disseminate at the most detailed level of the classification.

The hierarchical structure of the classification allows users the flexibility to output statistics at the level of the classification which best suits their particular purposes. Data can be presented at major group level, minor group level, or country level. If necessary, significant countries within a minor group can be presented separately, while the remaining countries within the group are aggregated. The same principle can be adopted to highlight significant minor groups within a major group.

One issue that is worthy of comment relates to the presentation of statistics for the United Kingdom. The United Kingdom is not identified as a separate unit at any level of the classification. For output purposes it is possible to derive a total for the United Kingdom by aggregating the totals of the following codes:

2101	England
2102	Scotland
2103	Wales
2104	Northern Ireland
2100	The United Kingdom and Ireland (not further defined)

This method will give a reasonably accurate total for the United Kingdom, as responses coded to 2100, The United Kingdom and Ireland (not further defined), will relate to the United Kingdom (including Northern Ireland) rather than to the Republic of Ireland. Responses that will be coded to the 'not further defined' category include Britain, British Isles, Great Britain, UK, etc. The response 'Ireland' is coded to 2107, the Republic of Ireland, as this is the probable country referred to. This may result in some undercounting for the unit 2104, Northern Ireland, and consequently for the United Kingdom. This results from the nature of responses obtained in statistical collections rather than the structure of the classification.

The Channel Islands and Isle of Man are direct dependencies of the Crown with their own legislative and taxation systems and not strictly part of the United Kingdom. They have been included in the minor group the United Kingdom and Ireland for statistical convenience.

9209	Madagascar
9210	Malawi
9211	Mauritius
9212	Mayotte
9213	Mozambique
9214	Namibia

9   AFRICA (excluding North Africa) - Continued

    92   Southern and East Africa - Continued

9215	Réunion
9216	Rwanda
9217	St Helena
9218	Seychelles
9219	Somalia
9220	South Africa
9221	Swaziland
9222	Tanzania
9223	Uganda
9224	Zambia
9225	Zimbabwe

SUPPLEMENTARY CODES

Supplementary codes are used to process inadequately described responses in statistical collections. The supplementary codes, listed below, are of two types:

- Codes commencing with zero are used to code responses which cannot be allocated a country, minor group or major group code (operational codes).

- Codes ending with zero are used to code responses which cannot be coded to the detailed level of the classification but can be coded to a higher level of the classification structure (not further defined codes).

A fuller explanation of Supplementary Codes and their application is provided in the **CODING SCHEME** of the Explanatory Notes.

List of Supplementary Codes

0000	Inadequately Described
0001	At Sea
0002	Not Elsewhere Classified
0003	Not Stated
1000	Oceania and Antarctica (not further defined)
1100	Australia (not further defined)
1200	Australian External Territories (not further defined)
1400	Melanesia (not further defined)
1500	Micronesia (not further defined)
1600	Polynesia (excuding Hawaii) (not further defined)
1700	Antarctica (not further defined)
2000	Europe and the USSR (not further defined)
2100	The United Kingdom and Ireland (not further defined)
2200	Southern Europe (not further defined)
2300	Western Europe (not further defined)
2400	Northern Europe (not further defined)
2500	Eastern Europe (not further defined)
2600	The USSR and the Baltic States (not further defined)
3000	The Middle East and North Africa (not further defined)
3100	The Middle East (not further defined)
3200	North Africa (not further defined)
4100	Southeast Asia (not further defined)
5100	Northeast Asia (not further defined)
6100	Southern Asia (not further defined)
7100	Northern America (not further defined)
8000	South America, Central America and the Caribbean (not further defined)
8100	South America (not further defined)
8200	Central America (not further defined)
8300	The Caribbean (not further defined)
9000	Africa (excluding North Africa) (not further defined)
9100	Central and West Africa (not further defined)
9200	Southern and East Africa (not further defined)

APPENDIX III
## MAIN ENGLISH SPEAKING COUNTRIES

MAIN ENGLISH SPEAKING COUNTRIES

For some statistical purposes, the categorisation of countries into 'English speaking' or 'non-English speaking' is considered useful for identifying people likely to have non-English speaking backgrounds. This information is used for compiling social reports, formulating access and equity initiatives, identifying EEO target groups, etc.

The list of Main English Speaking Countries provided here is not an attempt to classify countries on the basis of whether or not English is the predominant or official language of each country. It is a list of the main countries from which Australia receives, or has received, significant numbers of overseas settlers who are likely to speak English. The list therefore includes South Africa. Although large numbers of South Africans do not speak English as their first language, those who migrate to Australia are likely to speak English. The list does not include country units which are statistically insignificant in the Australian context, although they are English speaking countries.
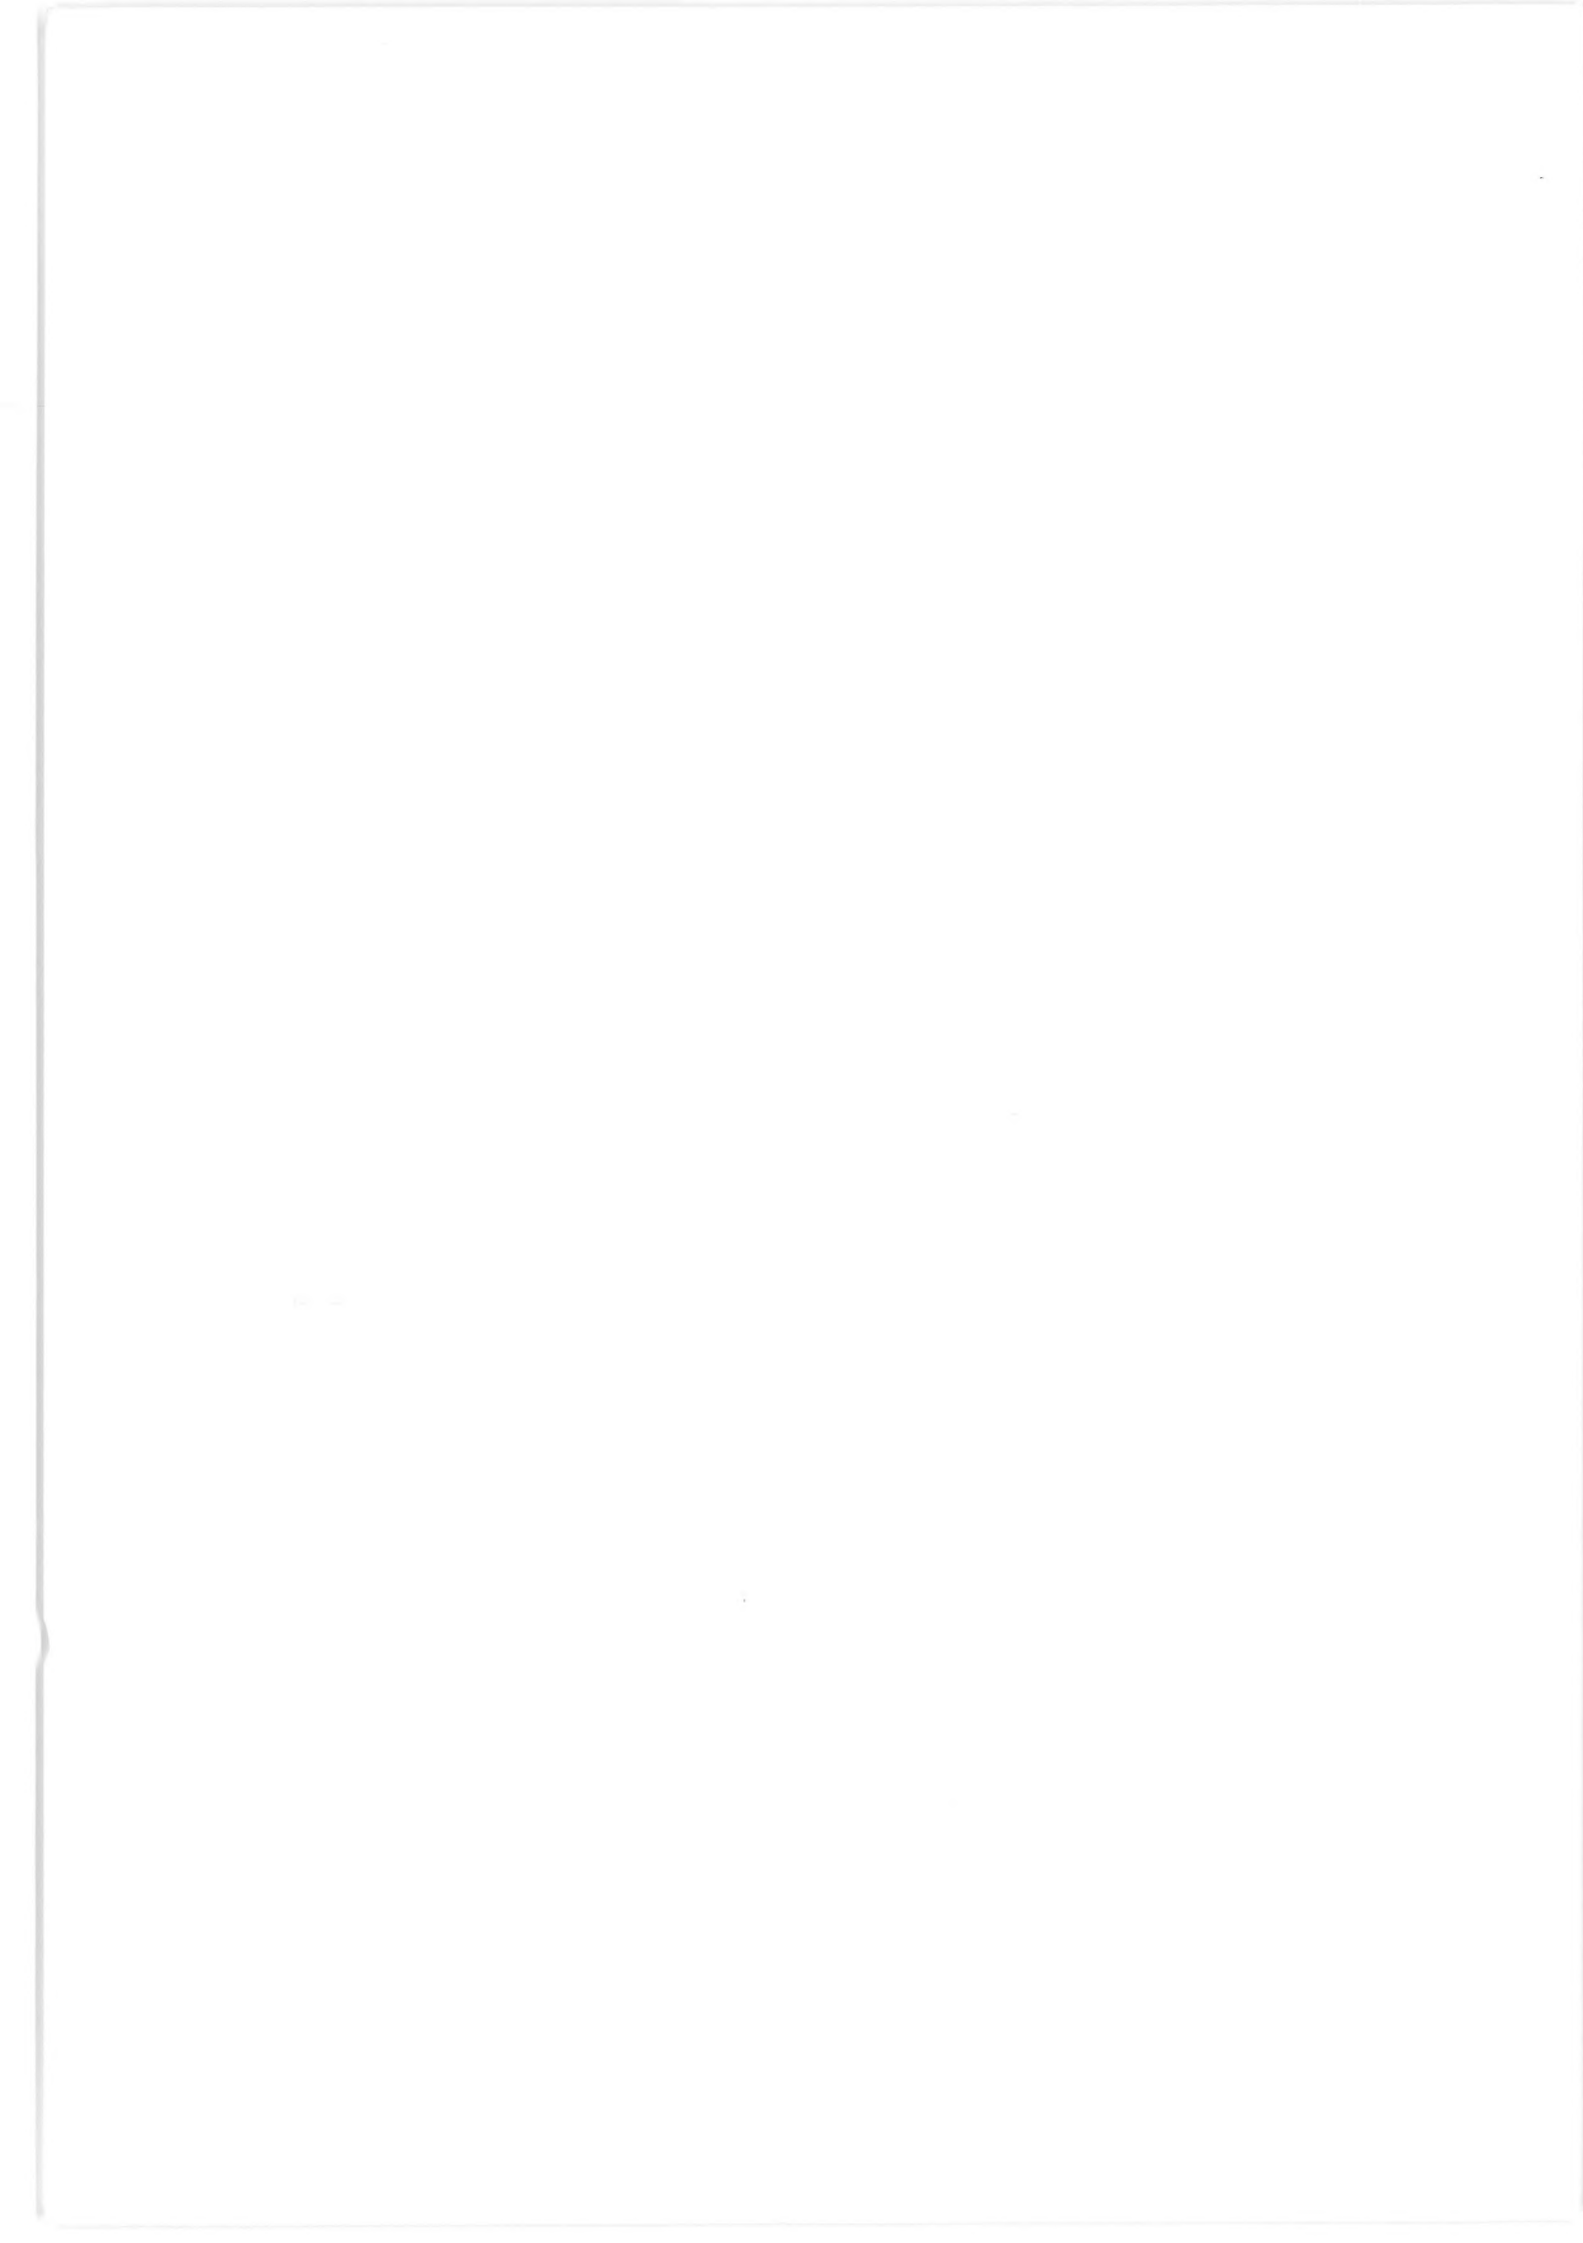

The set of Main English Speaking Countries used by the ABS consists of:

> Australia
> Canada
> Ireland, Republic of
> New Zealand
> South Africa
> United Kingdom
>> England
>> Scotland
>> Wales
>> Northern Ireland
> United States of America
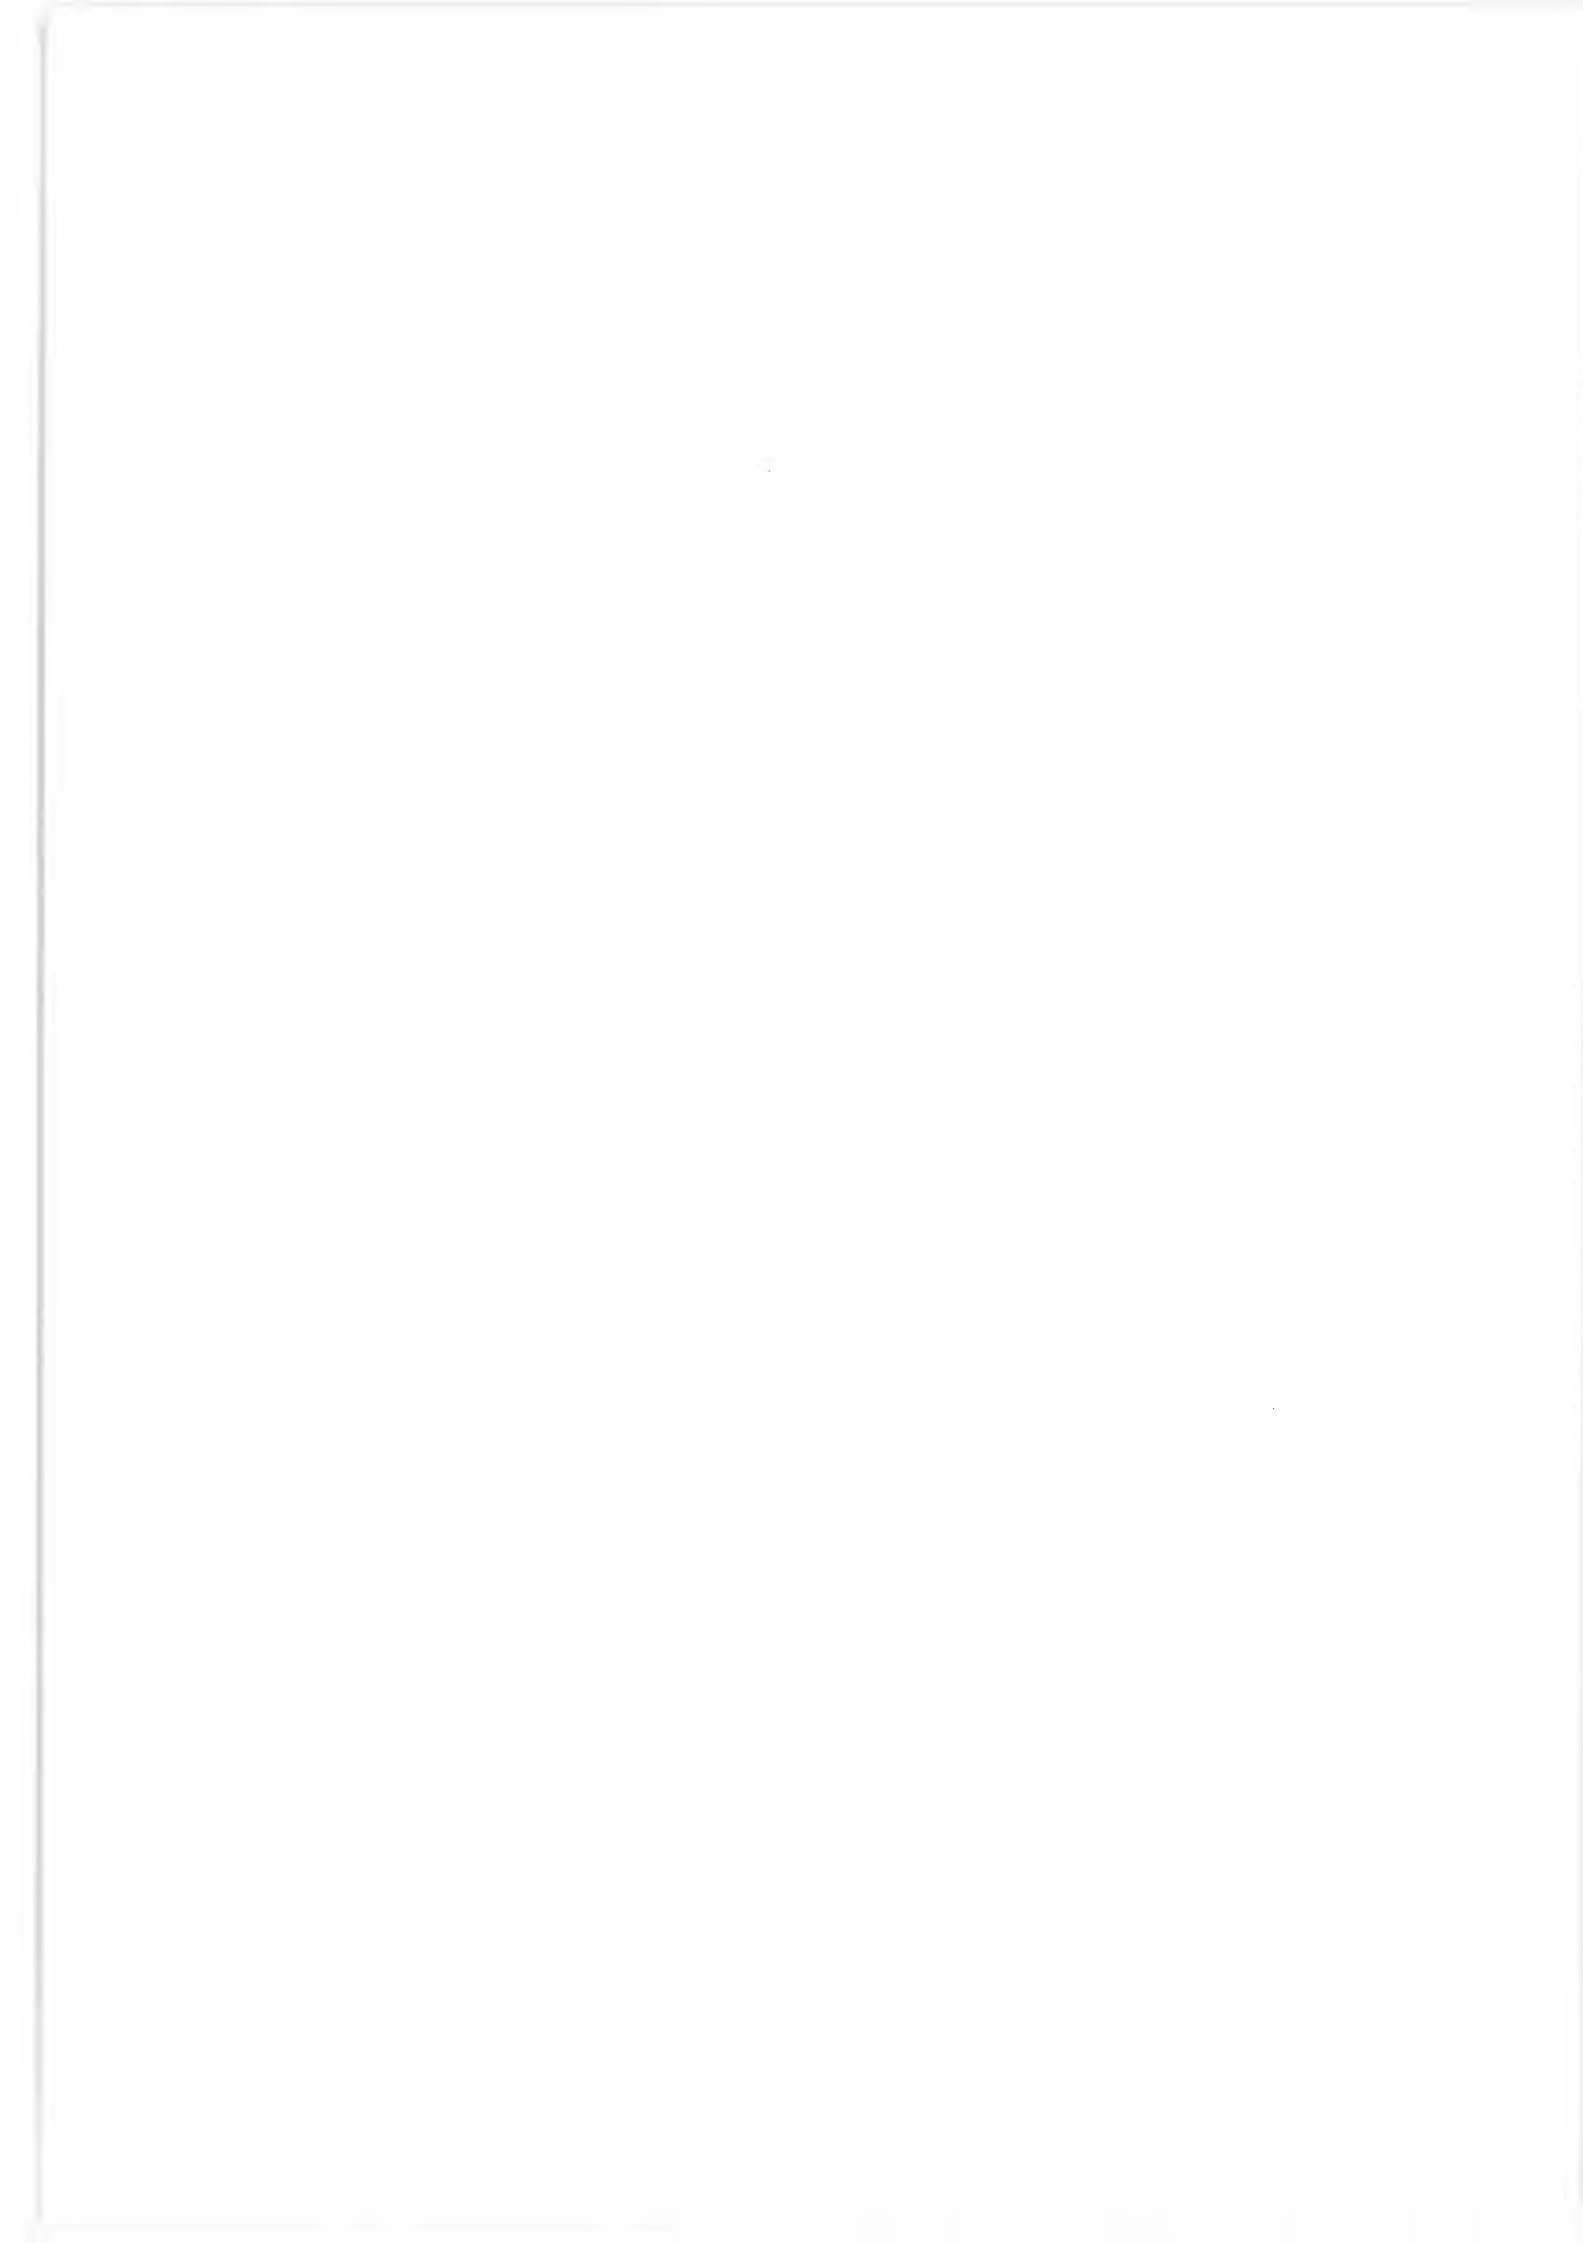

ASCCSS

APPENDIX IV
SHORT NAMES FOR PUBLICATION

SHORT NAMES FOR PUBLICATION

The country names employed in the classification are, in the main, the country names recommended to be used for all ordinary purposes by the United Nations in Terminology Bulletin No. 333: Names of Countries and Adjectives of Nationality, ST/CS/SER.F/333, 1985.

In a few instances the country name is accompanied by extra information to precisely define the coverage of the identified country unit, for example, 'China (excluding Taiwan Province)'.

Some of the names of the country units and groupings employed in the classification are too long for use in all circumstances, for example, in table stubs. To cater for these circumstances a list of generally accepted short names is provided below.

Full or Extended Country or Group Name	Short Name Alternative
The United Kingdom	UK
Ireland, Republic of	Ireland
Germany, Federal Republic of	West Germany
German Democratic Republic	East Germany
China (excluding Taiwan Province)	China
Korea, Democratic People's Republic of	North Korea
Korea, Republic of	South Korea
Taiwan (Province of China)	Taiwan
United States of America	USA
Virgin Islands, British	UK Virgin Is
Virgin Islands, United States	US Virgin Is
Comoros (excluding Mayotte)	Comoros
Oceania and Antarctica	Oceania[1]

---

1   The short title Oceania for this major group reflects the reality that Antarctica is generally a null category in social and labour statistics classified by country. Where this is not the case, the full unit group title should be used.
